Frequently Asked Questions

May 2017

How does the Power Sling® make work easier and safer for riggers?

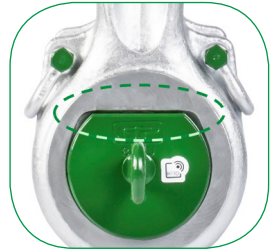

Multiple handling points

- A total of six shackles attached to the Power Sling's® body. Note: these handling points are not intended to lift the entire sling with, only the Power Sling® shackle itself.
- For all sizes an eye bolt is attached to the pin head
- For sizes >200t, two handling points are attached to the pin, one at pin head side the other at thread side
- For sizes >200t, one handling point is put off-center, this makes it easy to rotate the pin in position
- For sizes >700t, holes in nut for fastening with Tommy bar

Easier installation of the pin

- Shape of the shackle eye and the pin prevents the pin from rotating

Markings are always visible, also after long-term usage

- Markings on both sides of shackle body
- Markings are recessed into shackle body so will not wear or get damaged over time

Easier identification, inspection and tracking

- Area for additional marking on both sides of shackle body
- Area for additional marking on shackle pin
- RFID chips in both shackle body and pin

Bayonet Pin (Optional)

- Faster assembly of the shackle
- Reduces downtime (no repair of thread required, ever)
- Safer in use for riggers
- Lower risk of damage to adjacent components (e.g. synthetic- and wire rope)
